## COFACE PANORAMA SECTORS

### **14 BUSINESS SECTORS 3 LARGE REGIONS: EMERGING ASIA, NORTH AMERICA AND THE EUROPEAN UNION**

### **THE GAP BETWEEN EUROPE AND THE REST OF THE WORLD IS WIDENING WITH REGARD TO SECTOR RISK**

- **Globally, credit risk has increased in the metal industry and remains satisfactory in the energy and pharmaceutical sectors**
- **No sector in Europe has escaped the credit risk, while several sectors have seen their risk improve or be maintained at a contained level in Asia and in North America**
- **Focus: traditional retail channels face the boom in e-commerce, a source of risk and opportunities for companies**

### **Credit risks still high in Europe but the outlook is favorable in Emerging Asia and in North America**

The unique indicator<sup>1</sup>, developed by Coface economists and based on the payment experience of companies recorded by its underwriters, confirms a significant gap between sector risks in Emerging Asia and North America on one side and the European Union of 15 countries on the other.

In **Emerging Asia**, the risk is contained: three-quarters of the analyzed sectors present a moderate or medium risk. This region is characterized by constant growth in corporate turnover, between 4% and 16%, depending on the sectors. Pharmaceuticals is benefiting from the growing middle classes in India and in China, both markets also new major players in the manufacture of active ingredients for the pharmaceutical industry. Within the energy sector, the solar segment is affected by the fall in panel prices and has as a result seen its credit risk increase. The textile-clothing sector also needs to be watched, particularly in China, due to the relocation of production towards lower-cost countries.

Overall, the **North America** sectors show a medium risk, apart from the metal industry, where the risk continues to be high because of the inflow of cheap Chinese steel. As for the energy sector, it has seen its credit risk improve thanks to low-cost shale gas available to American industry. The automobile industry recorded sales up 4% in February 2013, benefiting from the resurgence of household consumption. We also note that the chemicals sector remains competitive, particularly due to historically low gas prices.

<sup>1</sup> Coface's credit risk indicator is based on changes in financial data published by over 6,000 listed companies from Emerging Asia, North America and the European Union of 15 countries: the change in turnover, profitability, net indebtedness ratio, cash flow and claims observed by Coface analysts. It is broken down into four risk categories: moderate, medium, high and very high.

**In Europe**, there is not a single sector in which the credit risk is moderate. The situation is particularly worrying in the metal industry, which has overcapacity and is exposed to the difficulties of its main customers - the automobile and construction industries. These latter two sectors are considered as at risk too, because they remain very vulnerable to sluggish European domestic demand. In the electronics sector, credit risks are increasing, as illustrated by the sharp drop in sales of computers.

#### **Traditional retail channels and e-commerce: towards a still risky hybrid European model**

The retail sector which is undergoing great changes following the boom in e-commerce (with turnover having almost doubled in 5 years), has started its transition towards a hybrid economic model, combining the advantages of the two business models. The traditional model of physical stores has run out of steam. At the same time, e-commerce continues to grow, helped by increased internet connection rates, increased security of transactions and competitive prices, against the background of a squeeze on consumer purchasing power. The cases of the UK market, forerunner of e-commerce with 12% of global sales, and France, which has gradually caught up with its online consumption habits, reflect the general overall trends.

However, this business model convergence turns out to be a source of additional risk for companies in the sector, particularly in Western Europe where credit risk has increased sharply. This is illustrated by deterioration in the payments experience recorded by Coface in the French retail sector, with the traditional segment displaying certain vulnerability. In the future, players must demonstrate responsiveness and adaptability. Traditional distributors need to introduce both multi-channel and cross-channel systems, to optimize the management of both their stock and their store areas. However, faced with growing competition, risks also need to be monitored among the pure e-commerce players, who must rely on the support of solid backing groups for financial consolidation.

#### **Credit risk in Romania**

In terms of national sectoral risk, we distinguished several sectors with a high number of insolvencies during 2012 in relation to 1,000 active companies. Thus, there were 123 insolvencies per 1,000 active companies in Construction and based on the Coface Romania's analysis (57% of the market) about 70% of them present high or significantly above average risks. A similar situation is observed in Metallurgy with 9 insolvencies per 1,000 active companies; 62% of them presented a high risk level, as well as the Transport sector with almost 96 insolvencies per 1,000 active companies and 75% of them with risks higher than the average.
